# Executive Summary

This project presents a comprehensive sales analysis of the Swiggy Sales Dataset using Microsoft Excel. The objective of this project is to transform raw sales data into meaningful business insights through data cleaning, analysis, visualization, and dashboard development.

The dataset contains 197,430 sales records collected from 993 restaurants across 28 states and 28 cities. Microsoft Excel, Power Query, Pivot Tables, Pivot Charts, and Slicers were used to clean, analyze, and visualize the data.

The interactive dashboard enables users to monitor sales performance, restaurant performance, customer ratings, and regional trends. The findings from this project can help businesses improve operational efficiency, identify high-performing markets, and support data-driven decision making.

## Project Objectives

- Analyze Swiggy sales performance.
- Clean and prepare raw sales data.
- Create an interactive Excel dashboard.
- Identify sales trends across different states and cities.
- Compare restaurant performance.
- Analyze customer ratings and pricing.
- Generate business insights for better decision making.

# Methodology

This project follows a descriptive and analytical methodology to examine the sales performance of Swiggy using Microsoft Excel. The primary objective is to convert raw sales data into meaningful business insights through data cleaning, analysis, visualization, and dashboard development.

## Data Source

The analysis was conducted using the Swiggy Sales Dataset, which consists of 197,430 records collected from 993 restaurants across 28 states and 28 cities. The dataset includes restaurant names, locations, food categories, dish prices, customer ratings, rating counts, and order dates.

## Tools and Technologies

The following tools were used throughout the project:

- Microsoft Excel
- Power Query
- Pivot Tables
- Pivot Charts
- Slicers
- Excel Functions

## Process

The project was completed through the following steps:

1. Data Collection
  - Imported the Swiggy Sales Dataset into Microsoft Excel.
2. Data Cleaning
  - Removed duplicate records.
  - Checked for missing values.

- Standardized text formatting.
- Verified date formats.

### 3. Data Preparation

- Organized the cleaned data into a structured format suitable for analysis.

### 4. Data Analysis

- Used Pivot Tables and Excel functions to analyze sales performance, restaurant performance, pricing trends, and customer ratings.

### 5. Dashboard Development

- Developed an interactive dashboard using Pivot Charts, KPI Cards, and Slicers.

### 6. Business Insights

- Interpreted the dashboard results to identify trends, high-performing restaurants, and regional sales performance.

### 7. Recommendations

- Proposed business recommendations based on the analytical findings.

## **Outcome**

The adopted research methodology enabled the transformation of raw sales data into an interactive dashboard that provides valuable insights into sales performance, customer preferences, and regional trends. These insights can support business managers in making informed decisions to improve operational efficiency and business growth.

# Dataset Description

The Swiggy Sales Dataset contains transactional sales data collected from restaurants operating across multiple cities in India.

## Dataset Information

- Total Records : 197,430
- Total Restaurants : 993
- States Covered : 28
- Cities Covered : 28
- Columns : 14

The dataset includes restaurant name, city, state, category, food type, dish name, sales price, ratings, order date, and rating count.

## Data Cleaning and Preparation

The following preprocessing steps were performed before analysis:

- Removed duplicate records.
- Checked missing values.
- Standardized text values.
- Corrected inconsistent formats.
- Verified date format.
- Created calculated fields where necessary.
- Loaded cleaned data into Pivot Tables.

# Dashboard Overview

The dashboard was developed using Microsoft Excel and provides an interactive overview of sales performance.

## Key Performance Indicators (KPIs)

- Total Sales
- Average Price
- Average Rating
- Number of Restaurants
- Number of States
- Number of Cities
- Top Performing Restaurants
- Category-wise Sales

## Business Insights

1. Sales vary significantly across different cities.
2. Highly rated restaurants generally achieve better sales performance.
3. Certain food categories contribute more revenue than others.
4. Premium-priced dishes usually receive higher customer ratings.
5. Regional analysis helps identify profitable markets.
6. Interactive filters allow dynamic comparison of business performance.

# Recommendations

- Focus marketing efforts on high-performing cities.
- Improve services in low-rated restaurants.
- Promote high-selling food categories.
- Optimize pricing strategies.
- Use dashboard insights for business planning.
- Monitor KPIs regularly for continuous improvement.

# Conclusion

The Swiggy Sales Analysis project demonstrates how Microsoft Excel can be used as a powerful business intelligence tool. By applying data cleaning, Pivot Tables, Pivot Charts, and interactive dashboards, meaningful business insights were extracted from a large dataset.

The project supports data-driven decision making by helping stakeholders understand sales performance, restaurant trends, customer behavior, and regional opportunities. This dashboard can be further enhanced by integrating Power BI or SQL for real-time analytics and advanced reporting.
